The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65551, ABZ66520 - ABZ66524, ABZ66530 - ABZ66530 - ABZ66530.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression of a nucleic acid molecule, that modulates human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancratic cancer, and HIV infection, and AIDS. The sequences shown in ABZ5989 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ6530 - ABZ6585 represent substrate/target sequences for the human ribozymes of the invention
                 The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       29-MAY-2001; 2001US-0294140P

                                                                                     acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human in ABZ6585 represent substrate/target sequences for the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti

                                                                                                                                                                                                                                                                                                                                             ACC68866), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonuclectides are useful as (1) as probes and primer received, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonuclectides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;

                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                       ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, of a quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (ant.) sense reagents, and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases the characterised by development of tumours or cell degeneration, are difficulty of the properties of tumours or cell degeneration,

The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in virro as (anti)sense reagents, and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              18-DEC-2003

The invention fragments of a

n relates at least

15 15

the isolation of 6327 nucleotide consecutive nucleotides of these

sequences, nucleotides,

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 173
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with ct the nucleotides. Fine nucleotides are used as probes or primers for detecting, cidentifying, quantifying and/or amplifying nucleic acids, as in vitro complete and antisense sequences, of nucleotides involved in tumour customers and antisense sequences, of nucleotides involved in tumour customers and to prepare transgenic animals, as an ecombinant polypeptides, and to prepare transgenic animals, as cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment cor real degeneration (e.g. Alzheimer's disease or schizophrenia).

Cc Analysis of the expression of the nucleotides can be used for diagnosis and ob used to screen for their specific interactive molecules, con potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC nucleotides. The nucleotides are used as probes or primers for detecting, CC identifying, quantifying and/or amplifying involved in vitro sense and antisense sequences, of nucleotides involved in tumour CC suppression or reversion, apoptosis and or vitral resistance, to produce CC recombinant polypeptides, and to prepare transgenic animals, as ceremental models. The nucleotides (also vectors containing them and CC calls containing the vectors), the encoded polypeptides and antibodies CC (Ab) against the polypeptide are useful for prevention and/or treatment CC or cell degeneration (e.g. Alrheimer's disease or schizophrenia).
CC analysis of the expression of the nucleotides can be used for diagnosis CC and/or prognosis of these diseases. The nucleotides and polypeptides can cC calso be used to screen for their specific interactive molecules.
CC potentially useful for treating diseases associated with abnormal cover of the nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches 12;

```

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce

                                                granted patent numbers. For further information please web site at www.derwent.com/dwpi/updates/ntis_us.html.)
                                                                           The labelled probes whose SQs are given in AAQ06030-2 are used for detecting amplified VP1 amino terminal genome region HAV cDNA. The met of the invention provides a rapid, sensitive and specific test for detecting the presence of HAV in infected or contaminated samples of e.g., stools, serum, water or foodstuffs such as shellfish. (Note: Revised entry submitted to correct the patent number format of US covernment cowned NTIS applications to prevent clashes with ongoing US granted patent numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia) analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be useful for treating diseases associated with abnormal expression of the nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Detection of hepatitis A virus in synthesising cDNA, amplifying the

                                                                                                                                                                                                                                                                                                                 The sequence is that of the hybridising region of tailed probe DRB82 for use in a method for determining HLA-DR beta sub-type in a nucleic acid sample. The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification of polymorphic sequences. The amplified DNA is useful for typing homozgous or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and can be utilised in tissue typing, determination of individual identity and identifying disease susceptible individuals. The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification of polymorphic sequences. The amplified DNA is useful for typing homozogous or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and can be utilised in tissue typing, determination of individual identity and identifying disease susceptible individuals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
The DNA from two corn inbred lines was restricted with TaqI and one of AseI, PstI, EcoRI or Sse8387-I and tagged with the appropriate adapters. This DNA was used as template in PCR reactions using one of the labelled TaqI primers, 1-4 and one of PstI-primers 1-4, AseI primers 1-4, CoRI-primers 1-4 or Sse8387-I primers 1-4, each primer contg. three selective nucleotides at the 3' end. A total of 128 PCRs was performed and the reaction prods. analysed. All primer combinations gave DNA fingerprints of 50-100 bands per lane, except for the combination SseI/TaqI, which gave only 10-15 bands per lane. The method can be used to identify preselected DNA fragments which can be polymorphic, i.e. RFLBs. It is a superior method for multiplex PCR. The method may also be used to detect evaluating genetic distances and characterising the plant. See also called the second plant or animal varieties, species etc, or for evaluating genetic distances and characterising the plant. See also called the second plant and AAQ38907-16.                                                                                                                         The blocker oligonucleotide p53(B) is complementary to its corresp. activator probe p53(A). The oligonucleotide was synthesised with a 5' bromodeoxyuridine nucleotide and may be used in an assay for the detection of the human p53 anti-oncogene in human DNA. See also AAQ34 62. (Updated on 25-MAR-2003 to correct PN field.)

The MEK2 gene (also called MAPKK2, mpk2, MAPK/ERK kinase 2, prmmk2 and erk activator kinase) represents a convergent target for the regulation of a range of cellular processes including proliferation, differentiation and development asMEK2 may be used to inhibit the expression of MEK2 genes in vivo and/or in vitro. MEK2 has been shown to be over expressed in some tumour cells. Therefore, asMEK2 may be administered to a patient to treat hepatocellular carcinomas and breast carcinomas. asMEK2 may also be used as a diagnostic tool to specifically inhibit the expression of MEK2 genes. The role of the inhibited genes in cellular pathways may then be evaluated. They may also be used as probes to detect sequences encoding MEK2 or as primers for the amplification of those sequences.                                                                       New polynucleotide from Escherichia coli encoding 6-phosphogluconate dehydrogenase and polymeric sequences in the nucleotide for detecting strains of E. coli for diagnosis and food screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound is useful for treating an animal, particularly humans, having or being
                                                                                                                                                                                     WPI; 2000-431304/37.

            This is a human G-alpha-12 antisense nucleotide sequence. G-alpha-12 is member of the G12/13 subfamily of G-proteins. The primary function of G-alpha-12 is in cell differentiation and growth. The invention relates to antisense compounds which are 8-30 nucleotides long (see AAE57666-Z57746). The antisense molecules are targeted to the human G-alpha-12 nucleic acid molecule, and inhibit the expression of G-alpha-12. The molecules preferably have a modified internucleotide linkage, and at least one modified sugar molety. The compounds target different regions of the human G-alpha-12 RNA. The expression of human G-alpha 12 is inhibited by contacting human cells or tissues in vitro with the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel oligonucleotide (I) comprising an adapter sequence and part of the target sequence of a restriction endoublease, and which has 1-10 selected nucleotides immediately adjacent to the 3' end of the target sequence. The products of the invention are used to tag restriction fragments which are to be amplified by the polymerase chain reaction (PCR). This technique may be used in the detection of restriction fragment polymorphisms (RFPs), including length polymorphisms. The products can also be used for genetic analysis, such as for the forenaic typing of humans and the detection of the inheritance of determined traits in animals or plants and to monitor several diseases at once. The oligonucleotides and kits may also be used to identify species, races or varieties of animals or plants. The new adapters, oligonucleotides and methods for using them are more sensitive for the terraction fragment polymorphisms because not only differences in the terraction fragment polymorphisms because not only differences in the terraction fragment polymorphisms because not only differences in the terractions fragment polymorphisms because not only differences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

Angiogenin inhibitors can be used in the treatment of angiogenesis. The presequence represents an oligonucleotide which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the efficiency of amplification of different fragments and products of certain primer pairs are not detectable with multiplex PCR. In contrass using the new techniques, all the primers have a substantial part of their nucleotide sequence in common and by selecting Amplified Fragmen Length Polymorphisms, the DNA markers are amplified with equal efficiency. AAZ44475-Z44526 represent primers used to illustrate the method of the invention. (Updated on 06-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                       be involved in signal transduction in the cell, and to have binding activity for other telomere-associated proteins. It is possible that it plays a role in the regulation of telomere length, thus affecting the replicative ability of the cell. The protein is useful for ribosylating target proteins, for determining tankyrase II binding activity in a sample, and for modulating telomere length in a cell. The present sequence is a PCR primer used in the isolation of the tankyrase II codir
                                                                                                                                                                30-NOV-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the isolation of the protein and codin sequences of human tankyrase II. The tankyrase II protein is thought to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel mammalian Tankyrase II polypeptide and the polynucleotide encoding the polypeptide useful for modulating or maintaining telomere length, replicative capacity, apoptosis, chromosome packing or gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human;

The MMP-Balt polypeptide can be expressed by standard recombinant methodology. The polynucleotides and polypeptides may be used as research reagents and materials for the discovery of treatments and diagnostics to human disease, and as targets for identifying modulators. Inhibitors of MMP-Balt polynucleotide or polypeptide expression may be used to treat and/or prevent arthritis, cancer and cancer metastasis, and diseases caused by cellular apoptosis including Parkinson's disease, Alzheimer's disease and Huntington's disease. Sequences AM447517-21 represent PCR
                                                                                                     A preparation of a probe-combined substrate, a probe array, dete a target substance, specification of the base sequence of a sing stranded nucleic acid in a sample, and determination of a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Probe sequence used in probe array SEQ ID

                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                         acid of a fungal pathogen possibly present in the sample with at least one oligonucleotide probe, from an Internal Transcribed Spacer (ITS) region. The method is useful for simultaneous detection and differentiation of clinically important fungi in a single assay, particularly Candida albicans, C. parapsilosis, C. tropicalis, C. kefyr, C. krusei, C. glabrata, C. dubliniensis, Aspergillus flavus, A. versicole, A. nidulans, A. fumigatus, C. neoformans and pneumocystis carinii. The method is especially useful in the detection of opportunistic infections in patients with impaired immunity systems, as organ transplants patients, patients receiving intensive anticancer treatments, diabetics or AIDS patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting and identifying fungal pathogens, especially Candida, Cryptococcus and Aspergillus, comprises hybridizing the amplified nucleic acid of the fungal pathogen with a probe from the internal transcribed spacer region of a DNA.
                                                                                                                                                                                                                                                                                                                    Sequence 18 BP; 3 A; 6 C; 4 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                            Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of analysing an unknown nucleic acid base sequence. The method comprises preparing a probe array, hybridising with the probe array, measuring the fluorescence yield in the reaction, obtaining a template pattern, producing a sample pattern, and comparing the sample pattern with the template pattern. The method is useful for specifying an unknown base sequence at a defined site of a target single-stranded nucleic acid, which is useful for analysing a nucleic acid base sequence. The method is applicable in DNA diagnosis and therapy, and is useful in medicine and biology. Measuring the fluorescence yield allows the detection of a one-base mismatch which can be considered to produce high detection of a one-base mismatch which can be considered to produce high detection in thermostability is less important, and the judgement on each spot can be reliably carried out.

                                              Query Match
                                                                                                                                                                      nucleic acid base sequence. The method is applicable in DNA diagnosis and therapy, and is useful in medicine and biology. Measuring the fluorescence yield allows the detection of a one-base mismatch which can be considered to produce high detection accuracy. The hybrid pattern of the DNA probe is used so the difference in thermostability is less important, and the judgement on each spot can be reliably carried out.
                                                                                                                                                                                                                                                                                                            The present invention relates to a method of analysing an unknown nucl acid base sequence. The method comprises preparing a probe array, hybridising with the probe array, measuring the fluorescence yield in reaction, obtaining a template pattern, producing a sample pattern, an comparing the sample pattern with the template pattern. The method is useful for specifying an unknown base sequence at a defined site of a target single-stranded nucleic acid, which is useful for analysing a
                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Screening an unknown base sequence at a defined site of a target single-stranded nucleic acid for use in DNA diagnosis and therapy, comprises a DNA chip, fluorescence yield and pattern-based method.

reaction, hybridising

base sequence.

The present invention relates to a method of analysing an unknown nucleic

sequence. The method comprises preparing a probe array, my with the probe array, measuring the fluorescence yield in the obtaining a template pattern, producing a sample pattern, and the sample pattern with the template pattern. The method is r specifying an unknown base sequence at a defined site of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                target single-stranded nucleic acid, which is useful for analysing a nucleic acid base sequence. The method is applicable in DNA diagnosis and therapy, and is useful in medicine and biology. Measuring the fluorescence yield allows the detection of a one-base mismatch which can be considered to produce high detection accuracy. The hybrid pattern of the DNA probe is used so the difference in thermostability is less important, and the judgement on each spot can be reliably carried out. ABK72503-ABK72524 represent DNA sequences described in the specification of the present invention
                                                                                                                                     The invention relates to a novel method for detecting a complex formed between a probe and its complement. The method is used for detecting a complex formed between an oligonucleotide of known basequence accomplementary probe, and for evaluating if the sequence is contained in liquid samples, or the level of binding by using the oligonucleotide as the detecting probe. The sequence represents a probe used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18
                                                                                                    Sequence
                                                                                                                                                                                                                               Example 3; Page 19; 25pp; Japanese.

The invention relates to a novel method for screening for a variation in a nucleic acid sequence. The method involves using a DNA array in which a group of probes which will give strong signals forming hybrids with a normal gene sequence, and a group of probes having sequences expected to form hybrids with gene variants are separately arranged. The method is useful for screening for the presence or absence of variation in a nucleic acid sequence. The presence or absence of a gene variation without need of an expensive apparatus and a complex analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; p53; probe; variation detection; DNA array; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-JUN-2002

The sequence was used as a target for hybridisation in the invention, and hybridises to probe #42. The invention relates to a novel method for screening for a variation in a nucleic acid sequence. The method involves using a DNA array in which a group of probes which will give strong signals forming hybrids with a normal gene sequence, and a group of probes having sequences expected to form hybrids with gene variants are separately arranged. The method is useful for screening for the presence or absence of variation in a nucleic acid sequence. The method is also useful for mass screening to determine rapidly the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening for gene variation by using DNA array in which probes giving strong signals forming hybrids with normal sequence, and probes having sequences expected to form hybrids with variants are separately arranged

                                      The invention relates to producing a probe support. The method involves (a) providing a liquid discharging device including reservoirs for containing liquids containing the probes and discharge mozzles connecting with the corresponding reservoirs; (b) aligning the discharge mozzles and the support relatively; and (c) discharging the liquids containing the probes from the discharge mozzles to different positions on the support. The number of reservoirs and discharge nozzles are the number of probes. The method is useful for producing probe supports useful in base sequence analysis of gene decoxyribonucleic acids (DNAs) and gene examination. The present sequence represents a base oligonuclectide used for preparation of a probe

Detecting nucleic acid with hybrid formation of a probe nucleic acid and a target nucleic acid without interference of the other double stranded nucleic molecules.

WPI; 2002-569947/61.

Example 1; Page 9; 13pp; Japanese

The invention describes a hybrid of a probe nucleic acid and a target nucleic acid for detection of nucleic acid. This sequence represents sythetic hybridisation probe used in the nucleic acid detection methors. invention a target method õ

                                                                                                                                                                                                                                                                                                          The invention describes a hybrid of a probe nucleic acid and a target nucleic acid for detection of nucleic acid. This sequence represents a sythetic target gene fragment for probe hybridisation used in the nucleic acid detection method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises a method for the synthesis of an end-labelled probe array - in which part of a probe for capturing a target substance is fixed at a plural of the matrix sites on the surface of a probe array substrate. In the method of the invention the units for constituting the probe are combined successively and, at the final stage of the successive synthesis, a labelling substance is combined to the end of the probe and extended to a desired chain length. The method of the invention is useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ន្តន្តន្ត
                                        provides for the use of antagonists of P450 enzymes for the prevention or alleviation of a tachyphylactic response to administration of a vitamin D canalogue, corticosteroid or macrolactam to a patient, e.g. for the treatment of psoriasis. The underlying cause of tachyphylaxis was shown to be degradation of a drug in the patient, rather than desensitization or receptor down-regulation. Exposure of a patient to the drug for extended periods results in an increase in the expression of enzymes which are capable of metabolizing the drug. A method for treatment of tachyphylaxis therefore involves inhibiting the induced metabolic enzyme, especially a p450 cytochrome, by administration of an antagonist of the enzyme. Detection of an increase in the amount and/or activity of a metabolic enzyme capable of metabolizing a drug following extended exposure of a cell from an individual to the drug indicates the increased likelihood of that individual developing a tachyphylactic response to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                   The present invention describes a method for determining simultaneously the reactivity of a first sample with other samples, in which the second to the 2 plus nth (n is not less than 1) samples having different properties are arranged independently on a substrate, on whose surface the first sample is already present, and the reactivities between the first sample and each of the second to the 2 plus n-th samples are determined. Also described is a tissue sample matrix in which several samples from different sources are present on each matrix divided on a substrate. The method is used for determining simultaneously the reactivity of a first sample with several other differing samples. ABL5965 to ABL59701 represent oligonucleotide probes used in an example from the present invention

The system displays a purchase order menu display, with the number of base sequences of DNA from which the orderer selects a DNA. The order information is transmitted to a successful bidder side server which orders for production and delivery of selected synthetic DNA. The system of the invention is useful for marketing synthetic DNAs of different base sequences and concentrations according to the desire of the user, especially genes concerned with human major histocompatibility complex

                         The invention relates to preparation of a probe array by high speed accourate dropping of the probe solution to improve quality of the parray. The probe array is useful in the analysis of base sequences and reliable genetic screening of multiple items. The present seque that of a probe used in examples of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mouth disease (FMD). The construct, vaccine and method are useful for protective immunisation against foot and mouth disease in animals. The construct is useful for preparity avaccine, which is particularly useful for stimulating protective response to such disease. The present sequence is porcine interferon (pIFN)-alpha DNA amplifying PCR primer. This sequence is used in the exemplification of the invention
                                                                                                                                       A process for preparation of a high density array of probes, used for DNA analysis and screening, comprising solution dropped on a carrier to form multiple spots at high speed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 18 BP; 4 A; 9 C; 3 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel construct comprising a DNA sequence capable of expressing interferon (IFN) in animals susceptible to foot and

The device comprises: (i) a solution discharge unit composed of reservoirs for housing the respective types of probe solutions; (ii) groups of discharging openings connected to the respective reservoirs; and (iii) discharging energy generating members corresponding to the respective discharging openings one by one. The device is suitable for manufacturing probe carriers, such as, DNA microchips etc. used for analysing base sequence of genetic DNA etc. The present sequence is a oligonucleotide used for preparing a probe, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Device for manufacturing a probe carrier used for analyzing of genetic DNA comprises discharging liquid through a group discharging openings on each probe spot.

Note: This sequence is shown in this orientation (5' to 3') in the disclosure of the specification, but is shown in the opposite orientation in the sequence listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the present inventor to a solution carrier with some types of probes. The device comprises: (i) a solution discharge unit composed of reservoirs for housing the respective types of probe solutions; (ii) groups of discharging openings connected to the respective reservoirs; and (iii) discharging energy generating members corresponding to the respective discharging openings one by one. The device is suitable for manufacturing probe carriers, such as, DNA microdevice is suitable for manufacturing probe carriers, such as, DNA microdevice is suitable for manufacturing probe carriers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Device for manufacturing a probe carrier used for analyzing of genetic DNA comprises discharging liquid through a group discharging openings on each probe spot.
The invention comprises a method for manufacturing a probe carrier. The method involves discharging and fixing probe solutions in the corresponding cavities according to information on the positions of respective types of probes. The method of the invention is useful for manufacturing probe carriers (e.g. DNA micro-chips). The present DNA
                                                                                                                                                    Manufacturing a probe carrier used for analyzing a base sequence of genetic DNA, comprises discharging a probe solution in a cavity located at each probe position on a probe carrier through a group of discharging
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 18

                                                                                                                                                                                                            The invention relates to a novel probe carrier and the method for manufacturing the carrier. The invention enables stable discharge of solution, and removes liquid droplets adhering to discharge nozzle. present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                          Probe carrier manufacturing method for inkjet liquid discharge head in direction orthogonal angle satisfying predetermined relation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel probe carrier and the method for manufacturing the carrier. The invention enables stable discharge of solution, and removes liquid droplets adhering to discharge nozzle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Probe carrier manufacturing method for inkjet system, involves scanning liquid discharge head in direction orthogonal to scanning direction, at angle satisfying predetermined relation.

                                                      A set of six oligonucleotide probes enable the risk of maternal- foetal transmission of subtype B HIV-1 to be evaluated. Probes 1 and 6 (see NAT43664 and AAT43669) allow detection of HIV-1 strains which are always transmitted to the foetus; probes 2-4 (see AAT43665-T43668) allow detection of strains which are never transmitted from mother to foetus. The present sequence is that of probe 2 and it detects HAR, LOUB, VIL and 2754 HIV-1 sequences
                                                                                                                                                                                                                                                                                                                                                                                   Human immunodeficiency virus p17 gene fragments, derived proteins and antibodies - useful for assessing the risk of maternal transmission of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A set of six oligonucleotide probes enable the risk of maternal foetal transmission of subtype B HIV-1 to be evaluated. Probes 1 and 6 (see AAT43664 and AAT43669) allow detection of HIV-1 strains which are always transmitted to the foetus; probes 2-4 (see AAT43665-T43668) allow detection of strains which are never transmitted from mother to foetus. The present sequence is that of probe 3 and it detects PAI, HMI, AMO, CHET, GOB, MOE, SIW, FLO, 2758, 2826, 4501, 4538 and 5613 HIV-1 sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Narwa R,

Probes 1 and 6 (see AAT43664 and AAT43669) allow detection of HIV-1 strains which are alway transmitted to the foetus; probes 2-4 (see AAT43665-T43668) allow detection of strains which are never transmitted from mother to foetus. The present sequence is that of probe 4 and it detects the CEL HIV-1

The second nucleic acid molecule operably linked to a second molecule encodes an RNA molecule or a polypeptide whose expression decreases the expression of an RNA or a polypeptide present in a malignant cell only. This method can eliminate residual neoplastic disease in a patient, where the disease has an immature hematopoietic progenitor cell with a well-defined gene rearrangement. Diseases such as chronic myelogenous leukaemia which is associated with a BCR/ABI gene rearrangement, acute lymphoblastic leukaemia and acute promyelocytic sequence 19 pp.
                                                                                                                                                                                                                                                                                                                                                    Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC This beta-actin 3' RT-PCR primer is used in a novel method of preparing CC drug-resistant, non-malignant haematopoletic cells. This method involves the construction of a new expression cassette comprising a first nucleic acid molecule which encodes resistance of a host cell to a cytotoxic eagent, operably linked to a first promoter which functions in the host cell and a second nucleic acid molecule operably linked to a second comprometer which functions in the host cell and a second nucleic acid molecule encodes an RNA molecule or a polypeptide whose expression decreases the expression of an RNA or a polypeptide present in a complex cell only. This method can eliminate residual neoplastic disease in a patient, where the disease has an immature hematopoietic progenitor cell with a well-defined gene rearrangement. Diseases such as chronic myelogenous leukaemia which is associated with a BCR/ABL gene rearrangement, acute lymphoblastic leukaemia and acute promyelocytic rearrangement may be treated using this method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   片
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC This sequence represents a primer used in the method of the invention for the detection of the presence or absence of chromosomal abnormalities, ce each abnormality being associated with a condition in a subject and each combined abnormality being associated with a condition in a subject and each come characteristic nucleic acid sequence. The come thouse comprises: (a) obtaining a sample of nucleic acids derived from a subject which may harbour one of the chromosomal abnormalities; (b) come the sample to a multiplex molecular amplification (MMA) compresedure, where a number of the characteristic sequences, if present in carefular amplification (MMA) compresedure, where a number of the characteristic sequences, if present in carefular amplification (MMA) and detecting the presence and/or absence of an amplicon compresent to the presence or capacity of the abnormal sequences to detect the presence or capacity of the abnormal sequences to detect the presence or capacity of the abnormal sequences to detect the presence or capacity of the proprises the use of at least 7 mutually distinct primers (MDP) in one single reaction mixture, each of the primers defining an end of at least one characteristic nucleic acid sequences, the characteristic nucleic acid sequences, the characteristic nucleic acid sequences ach being capacity of the MDP. The methods can be used for detecting chromosomal abnormalities associated with diseases including numerous leukaemia's, lymphoma's, carefulariant and malaroma's, gliona's, neuroblastoma's, carefulariant and malaroma's, gliona's, neuroblastoma's,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a specifically claimed PCR primer used in the isolation of oncofetal ferritin 1 (OFF1) protein. OFF1 has cytostatic, immunosuppressive, contraceptive, abortive and nootropic activities, and can be used as a vaccine. Compositions comprising the expression vector containing an OFF1 coding sequence, and the OFF1 coding in the treatment of transplant rejections, autoimmune diseases, pathological pregnancies; (c) for enhancing fertilisation rates convert of bone-marrow progenitor cells such as granulocyte monocytes. The OFF1 nucleotide sequence is useful for diagnosing cancer such as breast cancer, heptablastoma, leukaemia, Hodgkin's and non-CC Hodgkin's lymphomas and embryonnal tumours, Down's Syndrome, and pathological pregnancies such as spontaneous abortion and miscarriage, comparature contractions, toxaemia or premature delivery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOs 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                      The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in hum genes. These SNPs can be used in disease diagnosis and prediction of individual's susceptibility to disease, in forensic and paternity tes and in genetic mapping. In particular, the SNPs of the invention can used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson
                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Single nucleotide polymorphism; SNP; human; genetic disease disease susceptibility; cardiovascular system; endocrine uneurological system; forensic testing; paternity testing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                        Claim 8;

                                                                                                                                                The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testir and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The patent discloses autoantibodies in cancer patients specific for novel cancer-related antigens that are normally intracellular including homeobox proteins, HOXA7, HOXB7, ADP ribosylation factor 1 (Arf-1), ATP dependent iron transporter ABC-7 and a novel protein encoded by EcoRI/XhoI fragment isolated from bacteriophage lambda clone 44B.1. The presence of these autoantibodies is correlated with neoplastic processes in patients. Proteins of the invention are useful for screening for cancer in an individual. HOXB7 is useful for screening for cancer other than breast cancer, renal cell carcinoma, colon cancer or melanoma in an individual, by determining whether cells in the individual are expressing a gene product of HOXB7, expression of which is correlated with increased likelihood of cancer in the individual. It is useful for screening ovarian cancer or benign serous cystadenoma. HOXB7 proteins are useful to distinguish between neoplastic and non-neoplastic fluid accumulations in patients carrying a malignant diagnostics and in screening methods for therapeutically active materials. HOXB7 antibodies are useful for detecting epitopes found on proteins of the invention in histological sections of ovarian cancer tissue as well as in other solid tumours such as breast cancer and melanoma. The proteins of the invention are also used as vaccines. The present DNA sequence is a PCR primer which is used for any human berseart DNA sequence is a PCR primer which is used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                allowing the molecule to cross the membrane through the channel. The method is useful in delivering materials across membranes, particularly into cells or organelles, and subsequently producing transiently or stably transfected or transformed cells. The method is especially useful for delivering nucleic acid to a cell to achieve expression of a desired transgene by the cell, and for treating cancer cells, relying on a new non-viral system without LTR and the possible hazards connected with them. The present sequence represents a VirE2 specific oligo used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Delivering a material across a membrane, useful for producing transiently or stably transfected or transformed cells, comprises introducing Agrobacterium VirE2 into a membrane, where VirE2 forms a channel through

The primers may also be used as probes. The SPG4 gene encodes a spastin polypeptide. Mutations in the SPG4 gene are responsible for autosomal dominant familial spastic paraplegia. SPG4 polynucleotides, and their fragments, are used to screen DNA banks for sequences that encode spastin (particularly sequences in other mammals, specifically mice); to identify SPG4 mutations, or other genetic anomalies, particularly for diagnosis of autosomal dominant familial spastic paraplegia (PSF-AD); to identify promoters and other regulatory elements of the SPG4 gene; for detection and amplification; for recombinant production of spastin; and
                                                                                                                                                                                                                                                                                                                                                                                                                           Protecting plant from barley yellow dwarf virus infection, by transforming modified nucleic acid expressing translationally-altered RNA into a plant cell, which confers resistance against virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Barley yellow dwarf virus infection; BYDV; plant resistance; monocotyledon; wheat; Triticum; Sorghum; rice; Oryza; barley; Hordeum; maize; Zea; rye; Secale; triticale; cat; Avena; antiviral; gene therapy;
    plant resistance against infection with BYDV. The method is useful protecting a plant from BYDV infection, where the plant is a monocotyledon selected from wheat (Triticum), sorghum (Sorghum), ri
                                                                                                            comprises transforming a modified nucleic acid molecule into a plant cell, where the expression of the nucleic acid molecule results in the expression of a translationally altered RNA molecule which confers to texpression of a translationally altered RNA molecule which confers to texpression of a translationally altered RNA molecule which confers to texpression of a translationally altered RNA molecule which confers to texpression of a translationally altered RNA molecule which confers to texpression of a translationally altered RNA molecule which confers to the confers
                                                                                                                                                                                                                         The present invention relates to a new method of protecting a barley yellow dwarf virus (BYDY) infection. The method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          15-DEC-2000; 2000AU-00002103
